Parthenolide Covalently Targets and Inhibits Focal Adhesion Kinase in Breast Cancer Cells

Graphical Abstract

Highlights

- Parthenolide covalently reacts with C427 of FAK1 to inhibit FAK1 activity

- Parthenolide impairs FAK1 signaling in breast cancer cells

- Other sesquiterpene lactone natural products also target FAK1

SUMMARY

Parthenolide, a natural product from the feverfew plant (Tanacetum parthenium), possesses myriad therapeutic activities, including anti-inflammatory and anti-cancer effects. Here, we further study the parthenolide mechanism of action using activity-based protein profiling-based chemoproteomic platforms to map additional covalent targets engaged by parthenolide in human breast cancer cells. We find that parthenolide, as well as other related exocyclic methylene lactone-containing sesquiterpenes, covalently modify cysteine 427 of focal adhesion kinase 1 (FAK1), leading to impairment of FAK1-dependent signaling pathways and breast cancer cell proliferation, survival, and motility. These studies reveal a functional target exploited by members of a large family of anti-cancer natural products.

Parthenolide, a natural product found in the feverfew plant (Tanacetum parthenium), exerts multiple biological and therapeutic activities including anti-inflammatory and anti-cancer effects. Through covalent bond formation between its reactive α-methylene-γ-butyrolactone moiety and various protein targets, multiple cellular signaling pathways are affected (Ghantous et al., 2013; Kwok et al., 2001; Liu et al., 2018a; Mathema et al., 2012; Shin et al., 2017). Moreover, this natural product belongs to the broader family of sesquiterpene lactones (estimated at >5,000 members), many of which are also cytotoxic and have been hypothesized or shown to act through covalent mechanisms (Coricello et al., 2018; Quintana and Estevez, 2019). Parthenolide impairs cancer pathogenicity or confers chemotherapy or radiation sensitivity across a wide range of cancer types, including leukemia, colorectal, glioblastoma, cervical, liver, prostate, lung, pancreatic, skin, and breast cancers (Anderson and Bejcek, 2008; Carlisi et al., 2016; Diamanti et al., 2013; Jeyamohan et al., 2016; Kim et al., 2012, 2017; Lesiak et al., 2010; Lin et al., 2017; Liu et al., 2017; Morel et al., 2017; Ralstin et al., 2006; Sun et al., 2007; Sweeney et al., 2005). Despite possessing multi-target activity and exhibiting cytotoxicity across a wide range of human cancers, parthenolide is remarkably well tolerated in humans (Curry et al., 2004).

Using a biotinylated parthenolide analog, previous studies by the lab of Crews established that one of the primary targets that drives the anti-inflammatory and anti-cancer activity of parthenolide is IκB kinase β (IκK-β) wherein cysteine 179 (C179) is modified, thus impairing IκK-β and nuclear factor κB (NF-κB) signaling (Kwok et al., 2001). Additional studies have revealed other direct targets of parthenolide that may help to explain the therapeutic properties of this natural product, including targeting of specific cysteines within heat-shock protein Hsp72 and STAT3 downstream signaling targets such as Janus kinases JAK2 (Liu et al., 2018a; Shin et al., 2017). Moreover, this natural product has also been shown to affect additional cell signaling pathways including induction of oxidative stress and apoptosis, focal adhesion kinase 1 (FAK1) signaling, hypoxia-inducible factor 1α signaling, epithelial-to-mesenchymal transition, Wnt/β-catenin signaling, mitogen-activated protein kinase signaling, and mitochondrial function (Carlisi et al., 2011, 2016; Jafari et al., 2018; Kim et al., 2017; Kwok et al., 2001; Lin et al., 2017; Zhang et al., 2017). Based on the broader scope of influence on these biological pathways and systems, parthenolide likely still possesses additional targets that are not yet fully elucidated. In previous works investigating the direct targets of parthenolide, multiple studies have revealed unique ligandable and functional cysteines within their respective proteins that could be targeted to influence cellular signaling and pathogenicity. Recent studies have shown that activity-based protein profiling (ABPP)-based chemoproteomic platforms can be utilized to uncover unique and functional druggable hotspots and modalities, which can be accessed by covalently acting small molecules and natural products that may not be obvious using standard drug-discovery paradigms (Backus et al., 2016; Banerjee et al., 2013; Bateman et al., 2017; Grossman et al., 2017; Hacker et al., 2017; Spradlin et al., 2018; Ward et al., 2018; Weerapana et al., 2010). ABPP uses activity-based chemical probes to profile proteome-wide reactive, ligandable, and functional sites directly in complex proteomes. When used in a competitive manner, covalently acting small molecules can be competed against binding of activity-based probes to map the proteome-wide
targets of these compounds (Backus et al., 2016; Bateman et al., 2017; Grossman et al., 2017; Hacker et al., 2017; Roberts et al., 2017a; Wang et al., 2014). Importantly, this technology allows for the interrogation of natural products in their unmodified form.

In this study, we used ABPP chemoproteomic platforms to map additional targets of parthenolide in breast cancer cells, uncovering additional druggable hotspots that may contribute to the cell signaling and anti-cancer effects of parthenolide (Figure 1A). Parthenolide impaired cell proliferation and serum-free

cell survival, induced cell death, thwarted early cell motility, and significantly attenuated in vivo tumor xenograft growth in estrogen receptor, progesterone receptor, and HER2 receptor-negative breast cancer (tri- and quadruple-negative breast cancer [TNBC]) cells—231MFP or HCC38 cells—in a time-dependent and dose-responsive manner (Figures 1B–1F and S1). The impairment in cell viability induced by parthenolide, evidenced by propidium iodide-positive and annexin-V-positive cells, may be due to various forms of cell death, including apoptosis, necrosis, or ferroptosis. We show that parthenolide leads to the activation of caspase-3/7 and that this cell death is significantly attenuated by the pan-caspase inhibitor QVD-OPh, indicating that parthenolide impairs cell viability in a caspase-dependent manner (Figure S1) and suggesting that a portion of the cell death is apoptotic. We note that we are observing anti-tumorigenic effects at a relatively low dose of 30 mg/kg, despite observing cell-viability impairments at 50-µM concentrations. This may be because of the covalent nature of parthenolide and accumulating target engagement over time. Since parthenolide irreversibly binds to its targets, the targets will stay bound to parthenolide until the protein turns over. TNBCs show the worst prognoses due to the lack of key drug targets, and there are few targeted therapies (Dawson et al., 2009). Our data suggested that parthenolide may be effective at attenuating TNBC pathogenicity.

We next used ABPP methods to identify additional targets of parthenolide in breast cancer cells. To confirm that parthenolide was not completely non-specific, we first performed a competitive gel-based ABPP experiment in which we competed parthenolide against labeling of 231MFP breast cancer cell proteomes with a rhodamine-functionalized cysteine-reactive iodoacetamide (IA-rhodamine) probe. While this method is imprecise, we observed that parthenolide did not broadly inhibit global proteome-wide cysteine reactivity (Figure S1). Using a more specific, previously reported alkyn-functionalized parthenolide probe (parthenolide-alkyne) (Shin et al., 2017), we observed multiple labeled proteins in 231MFP proteomes, of which some, but not all, targets were competed by parthenolide (Figure S1). Collectively, these results indicated that parthenolide does possess multiple protein targets in 231MFP proteomes but that this natural product is not completely promiscuous in its reactivity.

While the parthenolide-alkyne probe could be used to identify additional targets of this natural product, we sought to map the specific amino acids within these targets that were engaged by unfunctionalized parthenolide. Thus, we next used isotopic tandem orthogonal proteolyis-enabled ABPP (isoTOP-ABPP) to identify specific ligandable sites targeted by parthenolide in 231MFP breast cancer proteomes. We competed parthenolide binding against the broadly cysteine-reactive alkyn-functionalized iodoacetamide probe (iodoacetamide-alkyne [IA-alkyne]) directly in 231MFP TNBC proteomes using previously established methods (Figure 2A and Table S1) (Backus et al., 2016; Bateman et al., 2017; Grossman et al., 2017; Roberts et al., 2017a; Weerapana et al., 2010). This analysis revealed three highly engaged targets of parthenolide that showed isotopically light vehicle-treated to heavy parthenolide-treated probe-modified peptide ratios of greater than 10, indicating >90% engagement of these sites—focal adhesion kinase 1 (FAK1) C427, paraoxonase 3 (PON3) C240, and DNA-protein kinase (DNA-PK or PRKDC) C729. FAK1 C427 was the top target showing the highest ratio, and thus we placed subsequent focus on investigating the role of FAK1-dependent effects of parthenolide in breast cancer cells (Figure 2A and Table S1). While the role of PON3 in cancer cells is unclear, FAK1 and PRKDC are known to be important drivers of cancer cell signaling and DNA repair, respectively. Notably, FAK1 and DNA-PK inhibitors have been shown to impair both cell survival and cell proliferation in cancer cells and are being pursued in the clinic (Helleday et al., 2008; Sulzmaier et al., 2014). Since C427 of FAK1 was the most highly engaged target in this study, we focused our attention on investigating the FAK1-dependent effects of parthenolide in TNBC cells.
We validated the interaction of parthenolide with C427 of FAK1 using several complementary approaches. We first validated the interaction of parthenolide with FAK1, whereby we showed parthenolide prevention of pure human FAK1 kinase domain cysteine reactivity with a rhodamine-functionalized iodoacetamide probe (IA-rhodamine) by gel-based ABPP (Figure 2A). Based on previous studies, we conjectured that parthenolide reacted covalently with C427 of FAK1 through a homo-Michael addition involving the $\alpha/\beta$ unsaturated lactone (Figure 2B) (Kwok et al., 2001). Second, we demonstrated that parthenolide covalently reacts with C427 of FAK1 by identifying this parthenolide adduct on human FAK1 kinase domain by liquid chromatography-tandem mass spectrometry (LC-MS/MS) (Figure 2C). We also demonstrated that IA-rhodamine labeling of pure human FAK1 was abrogated in the C427A mutant and that no additional inhibition of remaining IA-rhodamine labeling of FAK1 was observed with parthenolide treatment (Figure 2D). Using a parthenolide-alkyne probe, we further showed that this probe labeled wild-type FAK1 protein, and that this labeling was prevented by parthenolide or in the C427A mutant FAK1 protein (Figure 2E).

Previous studies have shown that FAK1 is amplified or overexpressed across a large fraction of breast tumors wherein FAK1 activity and expression is correlated with poor prognosis. FAK1 has been shown to be important in breast cancer cell survival, proliferation, and migration (Luo and Guan, 2010; Sulzmaier et al., 2014). To determine whether any of the observed parthenolide-mediated proliferative, survival, or migration impairments were dependent on FAK1, we assessed parthenolide effects on these phenotypes under FAK1 knockdown in 231MFP breast cancer cells (Figures 2F and 2G). FAK1 knockdown conferred significant resistance to parthenolide-mediated impairments in cell proliferation, serum-free cell survival, and cell migration, particularly at early time points, compared with control cells (Figures 2F and 2G), demonstrating that FAK1 contributes to the anti-cancer effects of parthenolide. Because parthenolide rapidly impairs cell proliferation and survival, we note that the migration phenotypes shown here are likely confounded by reduced cell viability from parthenolide treatment. Interestingly, FAK1 knockdown by small interfering RNA (siRNA) did not impair basal cell proliferation, survival, or migration. We postulate that this lack of effect may be due to either the multi-target polypharmacological nature of parthenolide, or potential adaptation to FAK1 knockdown during the inherently slower process of siRNA-mediated knockdown compared with acute inhibition of FAK1. We later show evidence for the latter hypothesis.

We next sought to determine whether parthenolide functionally inhibits FAK1 activity and signaling. On the basis of the previous study of previously reported crystal structures of FAK1, C427 resided in a loop region proximal to the ATP site, indicating that covalent modification of this site may be inhibitory (Iwatanli et al., 2013). Consistent with this premise, we showed that FAK1 activity was inhibited by parthenolide in vitro with pure human FAK1 kinase domain in a substrate activity assay (Figure 2H). While this paper was under revision, an elegant study describing the first structure-guided design, synthesis, and characterization of a FAK1 inhibitor that also covalently targeted C427 of FAK1 and inhibited its function was reported (Yen-Pon et al., 2019).

Importantly, this report gives further credence to our hypothesis of the functional relevance of this cysteine and its effects on cancer cell proliferation. FAK1 is activated through membrane recruitment by growth factors, extracellular matrix, and integrin signaling followed by subsequent autophosphorylation at Y397. This produces an SH2-binding domain, which in turn recruits Src and promotes semi-autophosphorylation of Y576/577 of FAK1. The fully active FAK1/Src complex can now recruit phosphorylate, and activate numerous targets including p130Cas/Bcar1 and paxillin (PXN) to drive cell motility and cytoskeletal modifications (Frame et al., 2010; Sulzmaier et al., 2014) (Figure 2I). We show that parthenolide, but not the analog dimethylaminoparthenolide, which lacks a reactive Michael acceptor, impaired multiple components of the FAK1 signaling pathway, including phosphorylation of FAK1 itself, as well as p130Cas and PXN phosphorylation in situ in 231MFP breast cancer cells (Figures 2J–2K). While FAK1 knockdown itself did not affect p130Cas and PXN phosphorylation, FAK1 knockdown conferred total resistance to parthenolide-mediated inhibition of p130Cas and PXN phosphorylation observed in siControl 231MFP cells (Figure 2L). These results suggest that the slower or longer knockdown of FAK1 by siRNA leads to a rewiring of FAK1 signaling to maintain p130Cas and PXN activity, but that the acute parthenolide-mediated inhibition of FAK1 signaling is still FAK1 dependent and contributes to the viability and motility impairments observed (Figures 2F and 2G).

Activation of FAK1 has also been shown to recruit phosphatidylinositol 3-kinase (PI3K) to activate AKT/PKC-mediated cell survival pathways (Figure 2F) (Frame et al., 2010; Sulzmaier et al., 2014). While we observed inhibition of AKT phosphorylation with parthenolide treatment, this inhibition was not attenuated in siFAK1 cells and was thus not mediated by parthenolide interactions with FAK1, but rather through interactions with other targets (Figure S2). Consistent with known interaction of parthenolide with IKK-$\beta$ to inhibit IKK-$\beta$ and NF-$\kappa$B signaling (Kwok et al., 2001), NF-$\kappa$B phosphorylation was inhibited by parthenolide, and this inhibition was also not driven through FAK1 (Figure S1). Nonetheless, our data demonstrate that C427 of FAK1 is both a covalent and functional target of parthenolide that contributes to acute inhibition of specific arms of the FAK1 signaling pathway and the overall anti-cancer effects of parthenolide.

Parthenolide, which belongs to the germacrane family of sesquiterpenes, is just one natural product among hundreds of known sesquiterpene lactones containing the reactive $\alpha$-methylene-$\gamma$-butyrolactone motif (Jackson et al., 2017). Many of these plant metabolites possess notable anti-cancer properties and have been employed in traditional medicine regimes (Ren et al., 2016; Silva Castro et al., 2017). Given the accessibility of C427, we wondered whether other related sesquiterpene lactones can also target this residue. The related germacrane costunolide and the guianolide natural product dehydrocostus lactone, which both contain $\alpha$-methylene-$\gamma$-butyrolactone pharmacophores, impaired 231MFP breast cancer cell survival (Figure 3A). On the other hand, the eudesmane-type sesquiterpene natural product $\alpha$-santonin, which does not contain this reactive functional group, did not impair 231MFP cell survival (Figure 3A). Consistent with these results, parthenolide, costunolide, and dehydrocostus lactone, but not $\alpha$-santonin, exhibited FAK1
Other Sesquiterpene Lactones Also Interact with FAK1 and Impair TNBC Cell Viability

(A) 231MFP breast cancer cell survival (48 h) after treatment with DMSO vehicle or parthenolide, and other sesquiterpene lactones (50 μM) assessed by Hoechst stain. 

(B) Gel-based ABPP analysis of parthenolide and other sesquiterpene lactones. Pure human FAK1 kinase domain was pre-treated with DMSO vehicle or natural products (50 μM) for 30 min prior to IA-rhodamine labeling (1 μM) for 1 h and then analyzed by in-gel fluorescence.

(D) Gel-based ABPP analysis of mikanokryptin analyzed as described in (B). 

(E) 231MFP breast cancer cell proliferation and survival (48 h) after treatment of cells with DMSO vehicle or mikanokryptin. Gels shown in (B) and (D) are representative of n = 3. Data shown in (A) and (E) are average ± SEM, n = 6 biological replicates/group. Significance is expressed as *p < 0.05 compared with vehicle-treated controls.
cysteine reactivity as shown by competitive IA-rhodamine labeling of FAK1 (Figure 3B). Moreover, the more highly oxidized guianolide sesquiterpene mikanokryptin (Tian et al., 2017), which also possesses differing stereochemistry relative to dehydrocostus lactone, also showed FAK1 cysteine reactivity and impaired 231MFP breast cancer cell proliferation and survival (Figures 3C–3E). Taken together, these findings indicate some flexibility in targeting this druggable hotspot with sesquiterpene natural products harboring reactive α-methylene-γ-butyrolactone homo-Michael acceptors. We do note, however, that this reactive cysteine has not been pinpointed in previous target identification studies employing related natural products (Tian et al., 2017).

In accordance with previous findings (Yen-Pon et al., 2018), we also discovered small, fully synthetic covalent binders of FAK C427 via a cysteine-reactive covalent ligand screen using gel-based ABPP against the pure human FAK1 kinase domain (Figure S2 and Table S2). After screening 149 covalent ligands, we found 15 potential hits that impaired IA-rhodamine labeling of FAK1 (Figure S2). We then evaluated these 15 compounds for 231MFP survival and proliferation impairment to identify compounds that gave similar responses to parthenolide. This led us to three promising leads, namely TRH 1–191, TRH 1–23, and TRH 1–171 (Figure S2). We then tested these compounds for FAK1 signaling impairment. While all three impaired Y397 FAK1 phosphorylation in 231MFP cells, TRH 1–191 was superior (Figure S2). We further confirmed that TRH 1–191 impaired FAK1 IA-rhodamine labeling at concentrations comparable with those of parthenolide without causing any artifactual protein precipitation that may arise from non-specific reactivity (Figure S2). While TRH 1–191 is a simple chloroacetamide fragment, we showed that a structurally similar negative control compound TRH 1–189 did not react with FAK1 and had no impact on FAK1 signaling (Figure S2). We also showed the corresponding TRH 1–191 covalent adduct on C427 of FAK1 by LC-MS/MS (Figure S3). TRH 1–191 also inhibited FAK1 activity in vitro, with pure FAK1 kinase domain protein and impaired FAK1 signaling in situ in 231MFP breast cancer cells (Figure S3). TRH 1–191 may thus represent an additional scaffold for targeting C427 of FAK1 to inhibit FAK1 signaling in cancer cells.

Here, we have used ABPP-based chemoproteomic platforms to identify C427 of FAK1 as a ligandable and functional site targeted by the anti-cancer natural product parthenolide. This target adds further complexity to the polypharmacological landscape of parthenolide, which also includes IKK-β, heat-shock protein Hsp72, and thioredoxin reductase as targets (Duan et al., 2016; Kwok et al., 2001; Shin et al., 2017). Moreover, these findings also implicate a broad array of widely examined natural products as potential FAK impairment agents. Previous studies have shown that parthenolide and other sesquiterpene lactone natural products inhibit the FAK1 signaling pathway, but the mechanism through which parthenolide inhibited this pathway was poorly understood. In this study, we use chemoproteomic platforms to identify C427 within FAK1 as a functional site targeted by multiple sesquiterpene lactone natural products, including parthenolide, to impact FAK1-dependent signaling pathways and breast cancer cell proliferation, survival, and motility.

**SIGNIFICANCE**

Previous studies have shown that parthenolide and other sesquiterpene lactone natural products inhibit the FAK1 signaling pathway, but the mechanism through which parthenolide inhibited this pathway was poorly understood. In this study, we use chemoproteomic platforms to identify C427 within FAK1 as a functional site targeted by multiple sesquiterpene lactone natural products, including parthenolide, to impact FAK1-dependent signaling pathways and breast cancer cell proliferation, survival, and motility.

**STAR METHODS**

Detailed methods are provided in the online version of this paper and include the following:

CONTACT FOR REAGENT AND RESOURCE SHARING

Further information and requests for resources and reagents should be directed to and will be fulfilled by the Lead Contact, Daniel K. Nomura (dnomura@berkeley.edu).

EXPERIMENTAL MODEL AND SUBJECT DETAILS

Cell Culture

Professor Benjamin Cravatt’s group provided the 231MFP cells. The generation of these cells have been described previously (Jessani et al., 2004). HCC38 and HEK293T cells were obtained from American Type Culture Collection (ATCC). These cell lines have not been authenticated. 231MFP cells were cultured in L-15 (HyClone) media supplemented with 10% fetal bovine serum (FBS) (Gibco) and 2 mM glutamine at 37°C and 0% CO2. HCC38 cells were cultured in RPMI (Gibco) supplemented with 10% FBS and 2 mM

Please cite this article in press as: Berdan et al., Parthenolide Covalently Targets and Inhibits Focal Adhesion Kinase in Breast Cancer Cells, Cell Chemical Biology (2019), https://doi.org/10.1016/j.chembiol.2019.03.016
glutamine at 37°C and 5% CO₂. HEK293T cells were cultured in DMEM (Gibco) supplemented with 10% FBS and 2 mM glutamine at 37°C and 5% CO₂. 231MFP, HCC38, and HEK293T cells are all female in origin.

In Vivo Animal Studies
Animal experiments were conducted in accordance with the guidelines of the Institutional Animal Care and Use Committee (IACUC) of the University of California, Berkeley. Female immune-deficient SCID mice (6-8 weeks old, 20-30 g body weight) purchased from Taconic laboratories were used for tumor xenograft studies. Mice were group housed and fed a standard chow diet. Mice were randomly assigned to experimental groups.

METHOD DETAILS

Chemicals
Parthenolide and dimethylaminoparthenolide were obtained from Cayman Chemicals. Synthesis of the parthenolide-alkyne probe was performed as previously reported (Shin et al., 2017). All other chemicals were obtained from Millipore-Sigma unless otherwise noted. Antibodies were obtained from Cell Signaling Technologies unless otherwise noted. Mikanokryptin was synthesized as previously described (Hu et al., 2017). Synthesis and characterization of cysteine-reactive covalent ligands screened against FAK1 were either described previously or described in Supporting Methods (Bateman et al., 2017; Grossman et al., 2017; Roberts et al., 2017b).

Cell Proliferation and Survival and Migration
Serum-containing cell proliferation and serum-free cell survival were assessed by Hoechst stain as previously described (Grossman et al., 2017; Louie et al., 2016). Briefly, we seeded cells at 1 x 10⁴ and 2 x 10⁴ cells/well, respectively, in 150 μL serum-containing or serum-free media in 96-well plates overnight. The next day, cells were treated with an additional 50 μL of DMSO vehicle or compound-containing media for 24 or 48 h before fixation and staining with 10% formalin and Hoechst 33342 (Invitrogen) according to manufacturer’s protocol. Wells were washed with PBS, and fluorescence was measured using a fluorescent plate reader with an excitation and emission of 350 nm and 461 nm, respectively.

For migration assays, cells (5 x 10⁴) were placed in collagen-coated Transwell chambers (Corning) and incubated in DMSO vehicle or compound-containing serum-free media for 6 h. Migrated cells were fixed and stained with Diff-Quik solution (Dade Behring) and non-migrated cells were removed using a cotton swab. Migrated cells were imaged and counted at 200 x magnification. An average of cells in three fields for one migration chamber represents n=1.

Flow Cytometry Studies
Apoptotic analyses were performed following cell exposure (6 cm plates, 1 x 10⁶ cells) to DMSO vehicle or compound-containing serum-free media using flow cytometry. Briefly, media and trypsinized cells were pelleted by centrifugation at 500 x g for 5 min, washed once in PBS, resuspended in binding buffer (10 mM HEPES/NaOH at pH 7.4, 140 mM NaCl, 2.5 mM CaCl₂) containing propidium iodide (BD) and FITC-conjugated Annexin V (BD) and incubated for 15 min. Cells were then diluted with additional binding buffer to a final volume of 0.5 mL and the fluorescence measured using a BD Biosciences LSR Fortessa cytometer. Annexin-V positive, propidium iodide negative cells were considered early apoptotic and Annexin-V positive, propidium iodide positive cells were considered late apoptotic, as previously described (Anderson et al., 2017). Data analysis was performed using FlowJo software and quantified for three biological replicates per condition.

Caspase 3/7 activity was performed using the CellEvent Caspase-3/7 Green Flow Cytometry Assay Kit (Thermo) according to manufacturer's specifications. Cells (1 x 10⁶) were pretreated with DMSO vehicle or 20 μM caspase inhibitor Q-VD-OPh for 1 h and then with DMSO vehicle or compound-containing serum-free media for an additional 4 h. Cells were then harvested and pelleted as described above and then resuspended in 0.5 mL PBS containing 500 nM CellEvent Reagent before incubating for 30 min at 37°C. For the final 5 minutes of incubation, SYTOX AADvanced was added to a final concentration of 1 μM. FlowJo Software was used for data analysis, and the percentage of cells exhibiting active caspase-3/7 was quantified for three biological replicates per condition. A t-test was employed for all statistical analyses.

Tumor Xenograft Studies
C.B17 SCID female mice (6-8 weeks old) were injected subcutaneously in the flank with 231MFP cells (1 x 10⁶ cells) suspended in serum-free media. Mice were exposed via intraperitoneal injection with either vehicle (18:1:1 PBS/ethanol/PEG40) or 30 mg/kg parthenolide once per day starting 2 weeks, respectively, after injection of cancer cells. Tumor size was assessed weekly by caliper measurements.

FAK1 Knockdown
Cells were plated in 6-well plates overnight (2 x 10⁵ cells/well). Cells were then treated with Dharmafect1 reagent (GE) and either non-targeting siRNA oligonucleotide (siControl, D-001810-10-05, GE) or siFAK1 oligonucleotides (L-003164-00, GE) were transfected for 48 h according to manufacturer instructions. Cells were then reseeded for survival and proliferation as described above. Knockdown was confirmed by Western blotting.
Vectors for FAK1 Kinase Expression

The full-length FAK1 expression vector was purchased from VectorBuilder (FAK1 sequence NM_005607.4). To express just the kinase domain (AA393-698) Gibson Assembly was performed using the primers CTGGCUCGGCATGCGCATggaacagatgtattgcgttattag, TCGAGCCGCGGTACGCCGTtcttggactacattcctcatgctctctcttgct to amplify the FAK1 kinase domain ORF with desired overlaps, and ACGGTACACGGCG, GCCGATCGCGCCGG to linearize the pCMV6-Entry backbone using a Gibson Assembly Cloning Kit (New England Biolabs) according to manufacturer protocol. To achieve the C427A mutant, site-directed mutagenesis was performed using Q5 Site-Directed Mutagenesis Kit (New England BioLabs) using the primers ACTTGGACGAGCTATTGGAGAAGGC, TCTATTCTTTCTCTTTGAATCTC according to manufacturer protocol.

Expression of FAK1 C427A Mutant

HEK293T cells were seeded at 30% confluency in 15 cm dishes in DMEM containing 2.5% FBS and 500 μL Opti-MEM (Thermo) containing 10 μg pCMV6-Entry-FAK1 either control or C427A vector and 50 μg polyethylenimine was added to the plate. 48 h later cells were scraped into 1 mL PBS and pelleted at 2,000 g for 5 min at 4°C and the supernatant removed before freezing at -80°C to achieve cell lysis. Pellets were then resuspended in 500 μL PBS and further lysed by probe tip sonication at 15% amplitude for 2 x 10 s on ice. Lysates were cleared by centrifugation at 21,000 g for 20 min at 4°C and the resulting supernatant was mixed with 30 μL anti-FLAG resin (Genescript) and rotated at 4°C for 2 h before washing 3 x with 500 μL PBS and subsequent elution of FLAG-tagged proteins with 100 μL of 250 ng/μL 3 x FLAG peptide (APEX BIO) in PBS. Resultant peptides were further concentrated and 3 x FLAG peptide removed using Amicon centrifugal filtration devices (Millipore).

Western Blotting

Cells (1 x 10^6 cells) were plated in 6 cm dishes in complete media the night before experiment. Cells were washed with PBS and placed in DMEM vehicle or compound-containing serum-free media for 2 h before being washed and collected into a lysis buffer containing protease and phosphatase inhibitors. Proteins were separated on a 4-20% Tris-Glycine precast Midi-PROTEAN TGX SDS/PAGE gel (BioRad). Proteins were then transferred to a PVDF membrane using the iBlot system (Invitrogen). Membranes containing protease and phosphatase inhibitors were blocked in 5% nonfat milk in TBST and incubated in primary antibodies overnight according to manufacturer instructions. Membranes were then washed in TBST and probed with secondary antibody (Li-Cor) and visualized using a fluorescent scanner (Li-Cor). Quantitation was performed using ImageJ.

FAK1 Activity Assay

FAK1 kinase domain (0.1 μg) was preincubated with DMSO vehicle or compound (100 μM) for 30 minutes at room temperature in 5 μL buffer containing 40 mM Tris, 20 mM MgCl2, 2 mM MnCl2, 4% DMSO, pH 7.4. ATP solution (5 μL of a 100 μM solution containing 0.1 μg 4:1 glycine:tyrosine peptide substrate (Promega)) was added and incubated at 37°C for 20 min before the addition of ADP-Glo reagent (5 μL) (Promega) for an additional 20 min incubation at room temperature. Kinase detection solution (10 μL) (Promega) was added and incubated for 15 minutes at room temperature and luminescence was measured on a plate reader.

Gel-Based ABPP

Recombinant FAK1 kinase domain was diluted to 0.002 μg/μL in PBS and 50 μL protein solution was treated with DMSO vehicle or compound for 30 min at room temperature. Samples were then incubated with IA-rhodamine (1 μM) (Thermo) for 1 h at room temperature in the dark before separating proteins by SDS/PAGE. Probe-labeled proteins were analyzed by in-gel fluorescence using a Bio-Rad gel scanner and fluorescent bands were quantified using Image J.

IsoTOP-ABPP Analysis of Parthenolide Targets

Cell lysate was collected and probe sonicated in PBS before diluting to 4 mg proteome per biological replicate. Samples were then preincubated with DMSO vehicle or parthenolide (50 μM) for 30 minutes at room temperature before labeling of proteomes with iodoacetamide (IA)-alkyne (10 μM) (Chess Organics) for 1 h at room temperature. Isotopically light (control) or heavy (treated) TEV-biotin handles (100 μM) were appended to probe-labeled proteins using CuAAC through sequential addition of tris(2-carboxyethyl) phosphine (1 mM, Sigma), tris[(1-benzyl-1H-1,2,3-triazol-4-yl)methyl]amine (34 mM, Sigma), copper (II), sulfate (1 mM, Sigma), and finally the linker functionalized with a TEV protease recognition sequence along with an isotopically light or heavy valine, and incubated for 1 h at room temperature. Probe-labeled proteins were subsequently mixed in a 1:1 ratio and precipitated by centrifugation at 6500 x g and washed in ice cold methanol, resuspended and washed again and then denatured and resolubilized by heating in 1.2% SDS/PBS to 80°C for 5 min. Insoluble components were precipitated by centrifugation at 6500 x g and soluble proteome was diluted in 5 mL 0.2% SDS/PBS before overnight incubation at 4°C with an additional 170 μL resuspended avadin-agarose beads. Bead-linked proteins were then washed three times in PBS and water and then resuspended in 6 M urea/PBS before being reduced in DTT (1 mM, Sigma) and heated to 65°C for 20 min, alkylated with iodoacetamide (18 mM, Sigma) and heated to 37°C for 30 min, then washed and resuspended in 2 M urea and trypsinized overnight with 0.5 mg/mL sequencing grade trypsin (Promega) at 37°C. Tryptic peptides were then eluted and the remaining beads were washed three times in PBS and water, once in TEV buffer solution (water, TEV buffer, 100 mM DTT), and resuspended in TEV buffer with Ac-TEV protease and incubated overnight at 29°C. TEV-digested peptides were then isolated, acidified with formic acid (1.2 M, Spectrum), and prepared for LC-MS/MS analysis, as previously described (Grossman et al., 2017; Roberts et al., 2017b).
Proteomic Profiling to Determine Sites of Modification of Parthenolide and TRH 1-191

FAK1 kinase domain (AA393-698) (Promega) (25 μM) was pre-incubated with DMSO vehicle or compound (parthenolide or TRH 1-191) (100 μM) for 30 min at room temperature. Samples were then treated with isotopically light (control) or heavy (treated) iodoacetamide (iodoacetamide-^1^C_2, 2-d_2, #721328, Millipore-Sigma) for 1 h at room temperature before combination of control and treated samples and subsequent precipitation with 20% trichloroacetic acid for 2 h at -80°C. Proteins were pelleted at 20,000 x g and washed with ice cold 10 mM HCl / 90% acetone before resuspension in 60 μL 4 M Urea and 0.5 x ProteaseMax (Promega), vortexed, and then subsequently diluted with an additional 40 μL 100 mM ammonium bicarbonate. Samples were incubated at 60°C for 30 min following the addition of 10 μL 110 mM TCEP, before dilution with 120 μL 0.04 x ProteaseMax and 5 μg/μL sequencing grade trypsin (Promega) in PBS. Samples were digested overnight at 37°C in a rocking incubator before acidification with 12 μL formic acid and storage at -80°C until MS analysis.

MS Analysis

Total peptides from TEV protease digestion for isoTOP-ABPP or tryptic peptides for shotgun proteomics were pressure loaded onto 250 μm tubing packed with Aqua C18 reverse phase resin (Phenomenex) and previously equilibrated using an Agilent 600 series HPLC using gradient from 100% buffer A to 100% buffer B over 10 min, followed by a 5 min wash with 100% buffer B and a 5 min wash with 100% buffer A. Samples were then attached to an equilibrated 13 cm laser pulled column packed with 10 cm Aqua C18 reverse-phase resin and 3 cm of strong-cation exchange resin using a MicroTee PEEK 360 mm fitting (Thermo Fisher Scientific #p-888), and then analyzed using a Q-Exactive Plus mass spectrometer (Thermo Fisher Scientific) using a Multidimensional Protein Identification Technology (MudPIT), using 0%, 25%, 50%, 80%, and 100% salt bumps of 500 mM aqueous ammonium acetate and a gradient of 5-55% buffer B in buffer A (buffer A: 95:5 water:acetonitrile, 0.1% formic acid; buffer B: 80:20 acetonitrile:water, 0.1% formic acid). Data was collected in data-dependent acquisition mode with dynamic exclusion enabled (60 s). One full MS (MS1) scan (400-1800 m/z) was followed by 15 MS2 scans (ITMS) of the nth most abundant ions. Heated capillary temperature was set to 200°C and the nanospray voltage was set to 2.75 kV, as previously described (Grossman et al., 2017; Roberts et al., 2017b).

Data was extracted using Raw Extractor 1.9.9.2 (Scripps Research Institute) in the form of MS1 and MS2 files and was subsequently searched against the Uniprot human database using ProLuCID search methodology in IP2 v.3 (Integrated Proteomics Applications, Inc.) (Xu et al., 2015). For isoTOP-ABPP, peptides were analyzed with a static modification for cysteine carboxymethylation (+57.02146) and differential modifications for light or heavy TEV tags (+464.28596 and +470.29977, respectively) for cysteine, and methionine oxidation, with up to two total modifications per peptide. For proteomic analysis of while FAK1 tryptic digests, peptides were searched with differential modifications for light or heavy iodoacetamide (+57.02146 and +61.04073, respectively) on cysteines, for parthenolide or TRH 1-191 addition (+248.14125 or +259.04001, respectively) on cysteines, and methionine oxidation, with up to two total modifications per peptide fragment. In both analyses, peptides were required to have at least one tryptic end and in isoTOP-ABPP all fragments must contain the TEV modification. To ensure a peptide false-positive of less than 5% ProLuCID data were filtered through DTASelect prior to downstream analyses (Tabb et al., 2002). Only peptides that were present in at least two out of four biological replicates were interpreted for final quantification and only those peptides with light to heavy ratios >10 that appeared in three out of four biological replicates were considered as targets of parthenolide.

General Synthetic Methods

Chemicals and reagents were purchased from major commercial suppliers and used without further purification. Reactions were performed under a nitrogen atmosphere unless otherwise noted. Silica gel flash column chromatography was performed using EMD or Sigma Aldrich silica gel 60 (230-400 mesh). Proton and carbon nuclear magnetic resonance (1H NMR and 13C NMR) data was acquired on a Bruker AVB 400, AVQ 400, or AV 600 spectrometer at the University of California, Berkeley. High resolution mass spectrum were obtained from the QBM mass spectrometry facility at the University of California, Berkeley using positive or negative electrospray ionization (+ESI or -ESI). Yields are reported as a single run.

General Procedure A

The amine (1 eq.) was dissolved in DCM (5 mL/mmol) and cooled to 0°C. To the solution was added acryloyl chloride (1.2 eq.) followed by triethylamine (1.2 eq.). The solution was warmed to room temperature and stirred overnight. The solution was then washed with brine and the crude product was purified by silica gel chromatography (and recrystallization if necessary) to afford the corresponding acrylamide.

General Procedure B

The amine (1 eq.) was dissolved in DCM (5 mL/mmol) and cooled to 0°C. To the solution was added chloroacetyl chloride (1.2 eq.) followed by triethylamine (1.2 eq.). The solution was warmed to room temperature and stirred overnight. The solution was then washed with brine and the crude product was purified by silica gel chromatography (and recrystallization if necessary) to afford the corresponding chloroacetamide.
N-(naphthalene-1-yl)acrylamide (TRH-1-57)
To a solution of 1-naphthylamine (294 mg, 2.0 mmol) in dichloromethane (10 mL) was added acryloyl chloride (0.20 mL, 2.4 mmol) followed by triethylamine (248 mg, 2.4 mmol) at 0°C under N₂ atmosphere. The reaction mixture was allowed to warm to room temperature and was stirred for 16 hours. The solution was washed twice with brine, and the resulting crude was purified by silica gel chromatography (30% to 40% ethyl acetate in hexanes) and recrystallized from toluene to yield 173 mg of white solid (44% yield).

1H NMR (400MHz, MeOD).
\[ \delta 7.96-7.94 (m, 1H), 7.88-7.86 (m, 1H), 7.76 (d, J = 8.1 Hz, 1H), 7.64 (d, J = 7.3 Hz, 1H), 7.52-7.44 (m, 3H), 6.43 (dd, J = 16.9, 10.4 Hz, 1H), 6.41 (dd, J = 16.9, 1.5 Hz, 1H), 5.82 (dd, J = 10.1, 1.0 Hz, 1H). \]

13C NMR (100MHz, MeOD).
\[ \delta 167.3, 135.7, 133.9, 132.1, 129.9, 129.4, 128.2, 127.7, 127.3, 127.2, 126.4, 123.8, 123.3. \]

N-(2,3-dihydro-1H-inden-1-yl)acrylamide (TRH-1-58)
To a solution of 1-aminoindan (274 mg, 2.0 mmol) in dichloromethane (10 mL) was added acryloyl chloride (0.20 mL, 2.4 mmol) followed by triethylamine (276 mg, 2.4 mmol) at 0°C under N₂ atmosphere. After stirring for 20 minutes, the reaction mixture was allowed to warm to room temperature and was stirred for 28 hours. The solution was washed twice with brine, and the resulting crude was purified by silica gel chromatography (20%-40% ethyl acetate in hexanes) to yield 238 mg of white solid (62% yield).

1H NMR (400MHz, CDCl₃).
\[ \delta 7.22-7.11 (m, 4H), 6.76 (d, J = 7.8 Hz, 1H), 6.23-6.13 (m, 2H), 5.56 (dd, J = 3.5, 8.1 Hz, 1H), 5.40 (q, J = 7.9 Hz, 1H), 2.95-2.88 (m, 1H), 2.84-2.76 (m, 1H), 2.51-2.43 (m, 1H), 1.83-1.74 (m, 1H). \]

13C NMR (100MHz, CDCl₃).
\[ \delta 165.5, 143.2, 143.1, 130.9, 127.8, 126.6, 126.3, 124.6, 124.0, 54.5, 33.7, 30.2. \]

N-(2,3-dihydro-1H-inden-5-yl)acrylamide (TRH-1-59)
To a solution of 5-aminoindan (269 mg, 2.0 mmol) in dichloromethane (10 mL) was added acryloyl chloride (0.20 mL, 2.4 mmol) followed by triethylamine (270 mg, 2.4 mmol) at 0°C under N₂ atmosphere. The reaction mixture was allowed to warm to room temperature and was stirred for 20 hours. The solution was washed twice with brine, and the resulting crude was purified by silica gel chromatography (40% ethyl acetate in hexanes) to yield 129 mg of white solid (34% yield).

1H NMR (400MHz, CDCl₃).

N-(naphthalene-2-yl)acrylamide (TRH-1-60)
To a solution of 2-naphthylamine (289 mg, 2.0 mmol) in dichloromethane (10 mL) was added acryloyl chloride (0.20 mL, 2.4 mmol) followed by triethylamine (289 mg, 2.4 mmol) at 0°C under N₂ atmosphere. After 15 minutes, the reaction mixture was allowed to warm to room temperature and was stirred for 16 hours. The solution was washed twice with 5% citric acid and once with brine, and the resulting crude was purified by silica gel chromatography (30% ethyl acetate in hexanes) to yield 266 mg of an off-white solid (67% yield).
$^1$H NMR (400MHz, MeOD). δ 8.25 (d, $J = 1.8$ Hz, 1H), 7.73-7.69 (m, 3H), 5.54 (dd, $J = 2.1$, 8.8 Hz, 1H), 7.39-7.34 (m, 1H), 7.33-7.29 (m, 1H), 6.44 (dd, $J = 9.7$, 17.0 Hz, 1H), 6.36 (dd, $J = 2.2$, 17.0 Hz, 1H), 5.72 (dd, $J = 2.2$, 9.7 Hz, 1H).

$^{13}$C NMR (100MHz, MeOD). δ 166.2, 137.1, 135.1, 132.4, 132.1, 129.5, 128.6, 128.5, 127.9, 127.4, 126.1, 121.1, 118.1.

N-(7-phenyl-2,3-dihydro-1H-inden-4-yl)acrylamide (TRH-1-68)

To a solution of N-(7-bromo-2,3-dihydro-1H-inden-4yl)acrylamide (TRH-1-65, 56 mg, 0.2 mmol) in a solution of dioxane and water (4:1 dioxane:water, 2.1 mL) was added sequentially phenylboronic acid (55 mg, 0.4 mmol), potassium carbonate (78 mg, 0.5 mmol), and tetrakis(triphenylphosphine)palladium(0) (26 mg, 10 mol%). The reaction mixture was heated to a reflux and stirred overnight. The reaction was diluted with water (20 mL) and extracted with DCM (3x20 mL). The combined organics were evaporated and the resulting crude was purified by silica gel chromatography (10% to 50% ethyl acetate in hexanes) then recrystallized from toluene to give 11 mg of white solid (20% yield).

$^1$H NMR (400MHz, MeOD). δ 7.48 (d, $J = 8.2$ Hz, 1H), 7.40-7.39 (m, 4H), 7.33-7.27 (m, 1H), 7.16 (d, $J = 8.2$ Hz, 1H), 6.53 (dd, $J = 10.2$, 16.9 Hz, 1H), 6.36 (d, $J = 17.0$ Hz, 1H), 5.77 (dd, $J = 1.7$, 10.2 Hz, 1H), 2.96 (t, $J = 7.3$ Hz, 2H), 2.91 (t, $J = 7.3$ Hz, 2H), 2.04 (quint, $J = 7.3$ Hz, 2H).

$^{13}$C NMR (100MHz, MeOD). δ 166.3, 144.2, 142.4, 139.2, 133.8, 132.2, 129., 129.3, 128.2, 127.9, 127.8, 123.0, 34.3, 32.1, 26.6.

N-(7-(4-(hydroxymethyl)phenyl)-2,3-dihydro-1H-inden-4-yl)acrylamide (TRH-1-70)

To a solution of N-(7-bromo-2,3-dihydro-1H-inden-4yl)acrylamide (TRH-1-65, 56 mg, 0.2 mmol) in a solution of dioxane and water (4:1 dioxane:water, 2.1 mL) under nitrogen atmosphere was added sequentially 4-(hydroxymethyl)phenylboronic acid (66 mg, 0.4 mmol), potassium carbonate (78 mg, 0.5 mmol), and tetrakis(triphenylphosphine)palladium(0) (26 mg, 10 mol%). The reaction mixture was heated to a reflux and stirred overnight. The reaction was diluted with water (20 mL) and extracted with DCM (3x20 mL). The combined organics were dried with magnesium sulfate, filtered, and evaporated, and the resulting crude was purified by silica gel chromatography (20% to 50% ethyl acetate in hexanes) to give 16 mg of white solid (26% yield).

$^1$H NMR (400MHz, MeOD). δ 7.47 (d, $J = 8.1$ Hz, 1H), 7.41-7.38 (m, 4H), 7.15 (d, $J = 8.2$ Hz, 1H), 6.53 (dd, $J = 10.2$, 16.9 Hz, 1H), 6.36 (d, $J = 17.0$ Hz, 1H), 5.77 (dd, $J = 1.7$, 10.2 Hz, 1H), 2.96 (t, $J = 7.3$ Hz, 2H), 2.91 (t, $J = 7.3$ Hz, 2H), 2.03 (t, $J = 7.3$ Hz, 2H).

$^{13}$C NMR (100MHz, MeOD). δ 166.3, 144.1, 141.4, 139.2, 133.8, 132.2, 129., 129.3, 128.2, 127.9, 127.8, 123.0, 34.3, 32.1, 26.6.

N-(2,3-dihydro-1H-inden-2-yl)acrylamide (TRH-1-74)

To a solution of 2-aminoindan (253 mg, 2.0 mmol) in dichloromethane (10 mL) was added acryloyl chloride (0.19 mL, 2.4 mmol) followed by triethylamine (222 mg, 2.4 mmol) at 0°C under N2 atmosphere. The reaction mixture was allowed to warm to room temperature after 15 minutes and was stirred for 23 hours. The solution was washed twice with brine, and the resulting crude was purified by silica gel chromatography (40% ethyl acetate in hexanes) to yield 126 mg of an off-white solid (35% yield).

N-(7-(benzo[d][1,3]dioxol-5-yl)-2,3-dihydro-1H-inden-4-yl)acrylamide (TRH-1-78)

To a solution of N-(7-bromo-2,3-dihydro-1H-inden-4yl)acrylamide (TRH-1-65, 55 mg, 0.2 mmol) in a mixture of dioxane and water (4:1 dioxane:water, 2.1 mL) under nitrogen atmosphere was added sequentially 3,4-(methylenedioxy)phenylboronic acid (70 mg, 0.4 mmol), potassium carbonate (74 mg, 0.5 mmol), and tetrakis(triphenylphosphine)palladium(0) (24 mg, 10 mol%). The reaction mixture was heated to a reflux and stirred overnight. The reaction was diluted with water (20 mL) and extracted with DCM (3x20 mL). The combined organics were dried with magnesium sulfate, filtered, and evaporated, and the resulting crude was purified by silica gel chromatography (0% to 25% ethyl acetate in hexanes) to give 7 mg of white solid (11% yield).

1H NMR (600 MHz, CDCl3). δ 7.93 (d, J = 7.0 Hz, 1H), 7.18 (d, J = 8.2 Hz, 1H), 7.10 (s, 1H), 6.90 (s, 1H), 6.86 (t, J = 8.1 Hz, 2H), 6.45 (d, J = 16.8 Hz, 1H), 6.30 (dd, J = 10.3, 16.8 Hz, 1H), 5.79 (d, J = 10.2 Hz, 1H), 3.00 (t, J = 7.3 Hz, 2H), 2.88 (t, J = 7.3 Hz, 2H), 2.10 (quint, J = 7.3 Hz, 2H).

13C NMR (150 MHz, CDCl3). δ 147.7, 146.7, 142.84, 142.81, 135.2, 134.9, 132.8, 131.3, 127.9, 127.8, 122.1, 119.8, 109.2, 108.3, 101.2, 36.8, 33.5, 30.5, 25.4.

N-(3-oxo-2,3-dihydro-1H-inden-4-yl)acrylamide (TRH-1-129)

To a solution of 4-aminoindan (1.0 g, 7.5 mmol) in ethanol (20 mL) at 0°C was added acetic anhydride (1.4 mL, 15.0 mmol). The solution was raised to room temperature and stirred overnight, after which the solvent was evaporated. The residue was then dissolved in acetone (50 mL) to which was added 15% aqueous magnesium sulfate (1.2 g in 6.75 mL of water) followed by potassium permanganate (3.4 g, 17.0 mmol), and the resulting solution was stirred for 24 hours. The reaction filtered through a pad of celite, eluting with chloroform and then water. The eluent was separated, and the aqueous layer was extracted several times with additional chloroform. The combined organics were dried over magnesium carbonate, and extracted with ethyl acetate. The combined organics were dried with magnesium sulfate, filtered, and evaporated. The residue was then dissolved in a 6N HCl solution (20 mL) and heated to 90°C. After stirring for 5 hours, the solution was cooled, neutralized with small portions of potassium carbonate, and extracted with ethyl acetate. The combined organics were dried with magnesium sulfate, filtered, and evaporated to give 610 mg (55% over 3 steps) of crude 7-aminoindan-1-one which was used without further purification.

To a solution of 7-aminoindan-1-one in dichloromethane (15 mL) was added acryloyl chloride (0.39 mL, 4.8 mmol) followed by triethylamine (0.67 mL, 4.8 mmol) at 0°C under N2 atmosphere. The reaction mixture was allowed to warm to room temperature and was stirred overnight. The solution was washed 1M HCl solution (2x) and brine, and the resulting crude was purified by silica gel chromatography (10% to 20% ethyl acetate in hexanes) to yield 390 mg of white solid (47% yield, 26% combined over 4 steps).

1H NMR (400MHz, CDCl3). δ 10.64 (s, 1H), 8.45 (d, J = 8.2 Hz, 1H), 7.55 (t, J = 7.9 Hz, 1H), 7.12 (d, J = 7.6 Hz, 1H), 6.45 (dd, J = 1.0, 17.0 Hz, 1H), 6.33 (dd, J = 10.1, 17.0 Hz, 1H), 5.82 (dd, J = 1.0, 10.1 Hz, 1H), 3.11 (t, J = 11.5 Hz, 2H), 2.74-2.71 (m, 2H).

13C NMR (100MHz, CDCl3). δ 209.3, 164.4, 155.9, 138.7, 137.0, 131.7, 128.0, 123.1, 120.8, 116.9, 36.5, 25.5.

N-(3-hydroxy-2,3-dihydro-1H-inden-4-yl)acrylamide (TRH-1-133)

To a solution of N-(3-oxo-2,3-dihydro-1H-inden-4-yl)acrylamide (TRH-1-129, 201 mg, 1.0 mmol) in anhydrous methanol (7 mL) under nitrogen atmosphere was added sodium borohydride (46.1 mg, 1.2 mmol). After 30 minutes of stirring, the reaction was quenched with saturated sodium bicarbonate solution and extracted three times with DCM. The combined organics were dried with magnesium
sulfate, filtered, and concentrated. Crude was purified by silica gel chromatography (30 to 50% ethyl acetate in hexanes) to give 190 mg of the product as a white solid (94% yield).

$^1$H NMR (400 MHz, CDCl$_3$). δ 8.93 (s, 1H), 7.98 (d, $J$ = 7.2 Hz, 1H), 7.19 (t, $J$ = 7.2 Hz, 1H), 6.95 (d, $J$ = 7.2 Hz, 1H), 6.29 (d, $J$ = 16.8 Hz, 1H), 6.15 (dd, $J$ = 10.2, 16.9 Hz, 1H), 5.66 (d, $J$ = 10.2 Hz, 1H), 5.32 (q, $J$ = 6.9 Hz, 1H), 3.60 (d, $J$ = 6.9 Hz, 1H), 2.96 (ddd, $J$ = 2.4, 9.0, 15.7 Hz), 2.73 (quint, $J$ = 8.1 Hz, 1H), 2.56–2.48 (m, 1H), 1.96–1.86 (m, 1H).

$^{13}$C NMR (100 MHz, CDCl$_3$). δ 164.1, 143.7, 135.6, 132.8, 131.6, 129.5, 127.3, 121.0, 118.5, 76.2, 36.0, 29.8.

HRMS (-ESI). Calculated: 202.0874 (C$_{12}$H$_{12}$NO$_2$). Observed: 202.0874.

N-(1-oxo-2,3-dihydro-1H-inden-4-yl)acrylamide (TRH-1-134)

To a solution of 4-nitroindan (5.38 g, 33 mmol) in acetic acid (250 mL) was slowly added chromium trioxide (8.95 g, 90 mmol). After stirring for 24 hours, the reaction was neutralized with 2M NaOH and extracted five times with ethyl acetate. The combined organics were washed with a saturated sodium bicarbonate solution and brine, then dried over magnesium sulfate, filtered, and concentrated. The crude material was purified by silica gel chromatography (10-20% ethyl acetate in hexanes) to give 1.26 g (ca. 7.1 mmol) of 4-nitroindanone as a white solid.

This intermediate was combined with palladium on activated charcoal (125 mg, 10 wt%) dissolved in anhydrous methanol (21 mL) under the atmosphere of a nitrogen balloon. Triethylsilane (11.3 mL, 71 mmol) was slowly added by addition funnel over the course of 10 minutes while the reaction was stirred under the cooling of a room temperature water bath. After an additional 20 minutes of stirring, the reaction mixture was filtered through a pad of celite and subsequently concentrated to give crude 4-aminoindanone which was used without further purification.

This final intermediate was then dissolved in DCM (21 mL) under N$_2$ atmosphere and cooled to 0°C, after which acryloyl chloride (0.77 mL, 9.5 mmol) and triethylamine (1.19 mL, 8.5 mmol) were slowly added. The reaction was allowed to warm to room temperature while stirring overnight, at which point the reaction was washed twice with brine, dried with magnesium sulfate, filtered, and concentrated. The crude was purified by silica gel chromatography (30-50% ethyl acetate in hexanes) to give 989 mg of a white solid (15% yield over 3 steps).

$^1$H NMR (400 MHz, CDCl$_3$). δ 8.20 (d, $J$ = 5.8 Hz, 1H), 7.63 (s, 1H), 7.56 (d, $J$ = 7.5 Hz, 1H), 7.39 (t, $J$ = 7.7 Hz, 1H), 6.48 (d, $J$ = 16.7 Hz, 1H), 6.37 (dd, $J$ = 10.0 Hz, 16.8 Hz, 1H), 5.83 (d, $J$ = 10.1 Hz, 1H), 3.04 (t, $J$ = 5.6 Hz, 2H), 2.70 (t, $J$ = 5.7 Hz, 2H).

$^{13}$C NMR (100 MHz, CDCl$_3$). δ 206.3, 163.9, 146.0, 138.0, 135.4, 130.7, 128.8, 127.6, 120.4, 36.1, 23.4.

HRMS (-ESI). Calculated: 200.0717 (C$_{12}$H$_{10}$NO$_2$). Observed: 200.0715.

N-(1-hydroxy-2,3-dihydro-1H-inden-4-yl)acrylamide (TRH-1-135)

To a solution of N-(1-oxo-2,3-dihydro-1H-inden-4-yl)acrylamide (TRH-1-134), 1.26 g (6.25 mmol) in anhydrous methanol (50 mL) under nitrogen atmosphere was added sodium borohydride (292.7 mg, 7.7 mmol). After 30 minutes of stirring, the reaction was quenched with water and the methanol was removed in vacuo. The residue was saturated with NaCl and extracted five times with a 2:1 chloroform:methanol solution. The combined organics were dried over 4 angstrom molecular sieves, filtered, and concentrated. The crude material was purified by silica gel chromatography (40 to 70% ethyl acetate in hexanes) to give 1.05 g of the product as a white solid (83% yield).

$^1$H NMR (400 MHz, MeOD). δ 7.50 (dd, $J$ = 2.3, 6.3 Hz, 1H), 7.25-7.20 (m, 2H), 6.51 (dd, $J$ = 10.2, 17.0 Hz, 1H), 6.35 (dd, $J$ = 1.7, 17.0 Hz, 1H), 5.77 (dd, $J$ = 1.7, 10.2 Hz, 1H), 5.17 (t, $J$ = 6.3 Hz, 1H), 2.97 (ddd, $J$ = 4.5, 8.6, 16.2 Hz, 1H), 2.74 (q, $J$ = 6.9 Hz, 1H), 2.47-2.39 (m, 1H), 1.95-1.86 (m, 1H).

$^{13}$C NMR (100 MHz, MeOD). δ 166.3, 148.0, 137.8, 134.8, 132.1, 128.3, 127.9, 124.0, 122.7, 76.9, 36.1, 28.6.
2-Chloro-N-(4-(4-chlorophenoxy)phenyl)acetamide (TRH-1-140)

To a solution 4-(4-chlorophenoxy)aniline (446 mg, 2.0 mmol) in dichloromethane (10 mL) was added chloroacetyl chloride (0.39 mL, 4.8 mmol) followed by triethylamine (0.67 mL, 4.8 mmol) at 0°C under N₂ atmosphere. After stirring for 35 minutes, the reaction mixture was allowed to warm to room temperature and was stirred for 27 hours. The solution was washed twice with brine, dried with magnesium sulfate, and the resulting crude was purified by silica gel chromatography (30% to 50% ethyl acetate in hexanes) to yield 533 mg of an off-white solid (89% yield).

\([N-(2-oxo-2-(phenylamino)ethyl)acrylamide (TRH-1-160)](https://doi.org/10.1016/j.chembiol.2019.03.016)

To a solution of glycine (1.50 g, 20.0 mmol) and sodium bicarbonate (1.70 g, 20.2 mmol) in water (30 mL) at 0°C was slowly added acryloyl chloride (2.45 mL, 30.2 mmol). After stirring for 3.5 hours, the reaction was extracted 3 times with ethyl acetate. The combined organics were dried over magnesium sulfate, filtered, and concentrated to give an oil. The oil was treated with hexanes causing a white solid to crash out which was collected by gravity filtration to give 124 mg of crude acryloylglycine of which 58 mg (47% of the crude material) was used immediately without further purification.

This solid (ca. 0.45 mmol) was dissolved in DMF (2.5 mL) and a solution of N-(3-dimethylaminopropyl)-N\textsubscript{0}-ethylcarbodiimide hydrochloride (104 mg, 0.54 mmol) and 4-dimethylaminopyridine (68 mg, 0.56 mmol) in DMF (2.5 mL) was added followed by aniline (0.050 mL, 0.54 mmol). The solution was stirred overnight, diluted with ethyl acetate, and washed with both a saturated solution of sodium bicarbonate and brine. The organics were then dried over magnesium sulfate, filtered, and concentrated, and the resulting crude was purified by silica gel chromatography (30-60% ethyl acetate in hexanes) to give 19 mg of the title compound as a white solid (1% yield over two steps).

\[ \text{H NMR (400 MHz, MeOD).} \delta 7.56-7.53 (m, 2H), 7.30 (t, J = 8.0 Hz, 2H), 7.08 (t, J = 7.4 Hz, 1H), 6.35 (dd, J = 9.9, 17.1 Hz, 1H), 6.26 (dd, J = 2.0, 17.1 Hz, 1H), 5.71 (dd, J = 2.0, 9.9 Hz, 1H), 4.08 (s, 2H). \]

2-Chloro-N-(4-(4-(furan-3-yl)phenoxy)phenyl)acetamide (TRH-1-189)

A reaction vial equipped with a stirbar was charged with 2-chloro-N-(4-(4-chlorophenoxy)phenyl)acetamide (TRH-1-140, 74 mg, 0.25 mmol), 3-furanylboronic acid (44 mg, 0.38 mmol), and XPhos-G3-palladacycle (4 mg, 2 mol%) and placed under a nitrogen atmosphere. THF (1 mL) and an aqueous solution of tribasic potassium phosphate (0.5M, 2 mL) that was freshly degassed by sparging with N2 were sequentially added, and the reaction was stirred for 1 hour. The reaction mixture was diluted with water and extracted three times with diethyl ether. The combined organics were dried over magnesium sulfate, and the resulting crude was purified by silica gel chromatography (10% to 30% ethyl acetate in hexanes) to give 19 mg of a white solid (23% yield).

1H NMR (400 MHz, CDCl3). δ 7.50-7.47 (m, 2H), 7.43 (dt, J = 2.6, 9.8 Hz, 2H), 7.30-7.24 (m, 3H), 6.95 (dt, J = 2.6, 9.7 Hz, 2H), 6.90 (dt, J = 2.7, 9.7 Hz, 2H), 6.43 (s, 1H), 3.58 (s, 2H).

13C NMR (100 MHz, CDCl3). δ 168.5, 156.2, 153.3, 144.2, 141.2, 133.4, 129.7, 128.1, 121.8, 119.7, 119.6, 117.9, 111.2, 33.9.

2-Chloro-N-(5-chloro-2-phenoxyphenyl)acetamide (TRH-1-191)

To a solution of 2-amino-4-chlorophenyl phenyl ether (2.20 g, 10.0 mmol) in dichloromethane (30 mL) was added chloroacetyl chloride (0.96 mL, 12.0 mmol) followed by triethylamine (1.67 mL, 12 mmol) at 0°C under N2 atmosphere. After stirring for 20 minutes, the reaction mixture was allowed to warm to room temperature and was stirred for 16 hours. The solution was diluted with DCM, washed with a saturated sodium bicarbonate solution and brine, dried with magnesium sulfate, and the resulting crude was recrystallized from hexanes to yield 1.84 g of light-brown solid (62% yield).

1H NMR (400 MHz, CDCl3). δ 8.93 (s, 1H), 8.50 (d, J = 2.5 Hz, 1H), 7.40-7.35 (m, 2H), 7.19-7.15 (m, 1H), 7.04-7.01 (m, 3H), 6.81 (d, J = 8.7 Hz, 1H), 4.16 (s, 2H).

13C NMR (100 MHz, CDCl3). δ 164.0, 156.0, 144.7, 130.2, 129.6, 129.2, 124.7, 124.5, 120.6, 118.71, 118.68, 43.1.

2-Chloro-N-(5-(furan-3-yl)-2-phenoxyphenyl)acetamide (TRH-1-194)

A reaction vial equipped with a stirbar was charged with 2-chloro-N-(5-chloro-2-phenoxyphenyl)acetamide (TRH-1-191, 297 mg, 1.0 mmol), 3-furanylboronic acid (171 mg, 1.5 mmol), and XPhos-G3-palladacycle (17 mg, 2 mol%) and placed under a nitrogen atmosphere. THF (2 mL) and a freshly degassed aqueous solution of tribasic potassium phosphate (0.5M, 4 mL) were sequentially added, and the reaction was stirred for 6 hours. The reaction mixture was diluted with water and extracted three times with diethyl ether. The combined organics were dried over magnesium sulfate, and the resulting crude was purified by silica gel chromatography (10% to 15% ethyl acetate in hexanes) to give 120 mg of a yellow solid (37% yield).

1H NMR (400 MHz, CDCl3). δ 8.53 (d, J = 2.4 Hz, 1H), 7.93 (s, 1H), 7.33-7.25 (m, 4H), 7.12 (t, J = 7.4 Hz, 1H), 6.97 (dd, J = 2.5, 8.7 Hz, 1H), 6.84 (d, J = 7.8 Hz, 2H), 6.79 (d, J = 8.7 Hz, 1H), 6.23 (s, 6.23), 3.52 (s, 2H).

13C NMR (100 MHz, CDCl3). δ 168.6, 156.3, 144.0, 143.4, 141.1, 130.9, 130.1, 129.7, 124.0, 123.9, 120.7, 119.6, 117.5, 117.4, 111.0, 34.2.

trans-2-Chloro-N-(5-(4-fluorostyryl)-2-phenoxyphenyl)acetamide (TRH-1-196)

A reaction vial equipped with a stirbar was charged with 2-chloro-N-(5-chloro-2-phenoxyphenyl)acetamide (TRH-1-191, 296 mg, 1.0 mmol), trans-2-(4-fluorophenyl)vinylboronic acid (253 mg, 1.5 mmol), and XPhos-G3 palladacycle (17 mg, 2 mol%) and placed under a nitrogen atmosphere. THF (2 mL) and a freshly degassed aqueous solution of tribasic potassium phosphate (0.5M, 4 mL) were sequentially added, and the reaction was stirred for 21 hours. The reaction mixture was diluted with water and extracted three times with diethyl ether. The combined organics were dried over magnesium sulfate, and the resulting crude was purified by silica gel chromatography (5% to 15% ethyl acetate in hexanes) to give 256 mg of a yellow solid (67% yield).

\[ \text{HRMS (+ESI)} \quad \text{Calculated: 404.0824 (C}_{22}\text{H}_{17}\text{NO}_{2}\text{ClFNa). Observed: 404.0828.} \]

N-(7-chloro-2,3-dihydro-1H-inden-4-yl)acrylamide (YP-1-1)

A solution of N-(2,3-dihydro-1H-inden-4-yl)acrylamide (187 mg, 1.0 mmol) in PEG 400 (5.2 mL) was cooled to 0 °C. To the solution was added \textit{N}-chlorosuccinimide (140 mg, 1.0 mmol). The solution was allowed to warm to room temperature after 30 min and stirred overnight. The solution was diluted with ethyl acetate and washed two times with brine and dried with magnesium sulfate. The crude product was purified via silica gel chromatography (30% ethyl acetate in hexanes). The obtained mixture of isomers was separated by recrystallization to afford the product in 22% yield as a white solid (47 mg).

\[ \text{HRMS (+ESI)} \quad \text{Calculated: 220.0535 (C}_{12}\text{H}_{11}\text{ClNO). Observed: 220.0533.} \]

N-(m-tolyl)acrylamide (YP-1-16)

A solution of o-toluidine (107 mg, 1.0 mmol) in DCM (10 mL) was cooled to 0 °C. To the solution was added acryloyl chloride (109 mg, 1.2 mmol) followed by triethylamine (121 mg, 1.2 mmol). The solution was allowed to warm to room temperature after 40 min and stirred overnight. The solution was washed two times with brine and dried with magnesium sulfate. The crude product was purified via silica gel chromatography (30% to 40% ethyl acetate in hexanes) to afford the product in 86% yield as a white solid (139 mg).

\[ \text{HRMS (+ESI)} \quad \text{Calculated: 162.0913 (C}_{10}\text{H}_{12}\text{NO). Observed: 162.0912.} \]

N-(2,3-dimethylphenyl)acrylamide (YP-1-18)

A solution of 2,3-dimethylaniline (121 mg, 1.0 mmol) in DCM (10 mL) was cooled to 0 °C. To the solution was added acryloyl chloride (109 mg, 1.2 mmol) followed by triethylamine (121 mg, 1.2 mmol). The solution was allowed to warm to room temperature after 29 min and stirred overnight. The solution was washed two times with brine and dried with magnesium sulfate. The crude product was purified via silica gel chromatography (30% to 40% ethyl acetate in hexanes) to afford the product in 88% yield as a white solid (154 mg).

**N-(1H-indol-4-yl)acrylamide (YP-1-19)**

A solution of 4-aminoindole (132 mg, 1 mmol) in DCM (5 mL) and DMF (5 mL) was cooled to 0°C. To the solution was added acryloyl chloride (109 mg, 1.2 mmol) followed by triethylamine (121 mg, 1.2 mmol). The solution was allowed to warm to room temperature after 26 min and stirred overnight. The solution was washed two times with brine and dried with magnesium sulfate. The crude product was purified via basic alumina chromatography (60% to 75% ethyl acetate in hexanes) to afford the product in 30% yield as a white-grey solid (56 mg).

**1H NMR (600MHz, MeOD)**: δ 7.51 (d, J = 7.6 Hz, 1H), 7.24-7.22 (m, 2H), 7.08 (t, J = 7.6 Hz, 1H), 6.64 (dd, J = 10.1, 16.7 Hz, 2H), 6.38 (dd, J = 1.7, 16.9 Hz, 1H), 5.78 (dd, J = 1.7, 10.3 Hz, 1H), 4.6 (s, 1H).

**13C NMR (150MHz, MeOD)**: δ 165.0, 137.2, 131.1, 129.2, 126.0, 123.8, 121.5, 120.9, 112.2, 108.4, 98.5.

**1-(4-Methylpiperazin-1-yl)prop-2-en-1-one (YP-1-22)**

A solution of 1-methylpiperazine (100 mg, 1.0 mmol) in DCM (10 mL) was cooled to 0°C. To the solution was added acryloyl chloride (109 mg, 1.2 mmol) followed by triethylamine (121 mg, 1.2 mmol). The solution was allowed to warm to room temperature after 30 min and stirred overnight. The solution was washed two times with brine and dried with magnesium sulfate. The crude product was purified via silica gel chromatography (85% to 100% ethyl acetate in hexanes) to afford the product in 29% yield as a yellow gel (44 mg).

**1H NMR (400MHz, CDCl3)**: δ 6.56 (dd, J = 10.6, 16.9 Hz, 1H), 6.29 (dd, J = 2.0, 16.8 Hz, 1H), 5.69 (dd, J = 2.0, 10.6 Hz, 1H), 3.71 (s, 2H), 3.58 (s, 2H), 2.42 (t, J = 5.1 Hz, 4H), 2.32 (s, 3H).

**13C NMR (100MHz, CDCl3)**: δ 166.4, 166.3, 128.0, 127.9, 127.8, 127.6, 59.1, 58.0, 57.1, 56.8, 47.4, 47.1, 46.7, 46.6, 45.3, 44.8, 28.1, 26.9.

**HRMS (+ESI)**: Calculated: 155.1179 (C8H15N2O). Observed: 155.1178.
1-(4-acetylpiperazin-1-yl)prop-2-en-1-one (YP-1-24)
A solution of 1-acetylpiperazine (128 mg, 1.0 mmol) in DCM (10 mL) was cooled to 0°C. To the solution was added acryloyl chloride (109 mg, 1.2 mmol) followed by triethylamine (121 mg, 1.2 mmol). The solution was allowed to warm to room temperature after 23 minutes and stirred for two hours. The solution was washed twice with brine and dried with magnesium sulfate. The crude product was purified via silica gel chromatography (0% to 10% methanol in DCM) to afford the product in 18% yield as a yellow oil (40 mg).

$^1$H NMR (400MHz, CDCl$_3$). $\delta$ 6.57 (dd, $J = 10.5, 16.8$ Hz, 1H), 6.33 (dd, $J = 1.8, 16.8$ Hz, 1H), 5.75 (dd, $J = 1.9, 10.5$ Hz, 1H), 3.72 (s, 1H), 3.66-3.64 (m, 3H), 3.57 (s, 1H), 3.51-3.49 (m, 2H), 2.13 (s, 3H).

$^{13}$C NMR (100MHz, CDCl$_3$). $\delta$ 165.6, 128.7, 127.0, 41.9, 41.4, 21.4.

HRMS (+ESI). Calculated: 183.1128 (C$_9$H$_{15}$N$_2$O$_2$). Observed: 183.1126.

1-(4-(Ethylsulfonyl)piperazin-1-yl)prop-2-en-1-one (YP-1-25)
A solution of 1-(ethanesulfonyl)piperazine (178 mg, 1.0 mmol) in DCM (10 mL) was cooled to 0°C. To the solution was added acryloyl chloride (109 mg, 1.2 mmol) followed by triethylamine (121 mg, 1.2 mmol). The solution was allowed to warm to room temperature after 27 min and stirred for two hours. The solution was washed twice with brine and dried with magnesium sulfate. The crude product was purified via silica gel chromatography (1% to 10% methanol in DCM) to afford the product in 70% yield as a white-yellow solid (163 mg).

$^1$H NMR (400MHz, CDCl$_3$). $\delta$ 6.57 (dd, $J = 10.5, 16.8$ Hz, 1H), 6.32 (dd, $J = 1.9, 16.8$ Hz, 1H), 5.76 (dd, $J = 1.8, 10.5$ Hz, 1H), 3.77 (s, 2H), 3.67 (s, 2H), 3.32 (t, $J = 5.2$ Hz, 4H), 2.98 (q, $J = 7.5$ Hz, 2H), 1.37 (t, $J = 7.4$, 3H).

$^{13}$C NMR (100MHz, CDCl$_3$). $\delta$ 165.5, 128.8, 127.0, 77.4, 45.9, 45.6, 44.2, 41.9, 7.8.

HRMS (+ESI). Calculated: 233.0954 (C$_9$H$_{17}$N$_2$O$_3$S$^1$). Observed: 233.0953.

N-(Furan-2-ylmethyl)acrylamide (YP-1-26)
A solution of furfurylamine (97 mg, 1.0 mmol) in DCM (10 mL) was cooled to 0°C. To the solution was added acryloyl chloride (109 mg, 1.2 mmol) followed by triethylamine (121 mg, 1.2 mmol). The solution was allowed to warm to room temperature after 17 min and stirred for two and a half hours. The solution was washed twice with brine and dried with magnesium sulfate. The crude product was purified via silica gel chromatography (35% to 70% ethyl acetate in hexanes) to afford the product in 86% yield as a white solid (132 mg).

$^1$H NMR (400MHz, CDCl$_3$). $\delta$ 7.33 (s, 1H), 6.60 (s, 1H), 6.31-6.22 (m, 3H), 6.15 (dd, $J = 10.1, 16.9$ Hz, 1H), 5.63 (dd, $J = 1.6, 10.1$ Hz, 1H), 4.48 (d, $J = 5.6$ Hz, 2H).

$^{13}$C NMR (100MHz, CDCl$_3$). $\delta$ 165.5, 151.2, 142.2, 130.6, 126.8, 110.5, 107.5, 36.5.

HRMS (+ESI). Calculated: 152.0706 (C$_8$H$_{10}$O$_2$N$^1$). Observed: 152.0706.

2-chloro-N-(cyclohexylmethyl)acetamide (YP-1-31)
Following General Procedure B starting from cyclohexamethylamine (113 mg, 1.0 mmol), product was obtained after silica gel chromatography (100% dichloromethane to 3% methanol in dichloromethane) in 60% yield as a white solid (112 mg).

$^1$H NMR (400MHz, CDCl$_3$). $\delta$ 6.70 (s, 1H), 4.06 (s, 2H), 3.15 (t, $J = 6.47$ Hz, 2H), 1.77-1.65 (m, 5H), 1.56-1.46 (m, 1H), 1.30-1.10 (m, 3H), 1.00-0.90 (m, 2H).
$^{13}$C NMR (100MHz, CDCl$_3$)
$\delta$ 165.8, 58.1, 46.0, 42.8, 37.7, 30.7, 26.3, 25.7, 18.2.

N-(4-bromophenyl)acrylamide (YP-1-36)
Following General Procedure A starting from 4-bromoaniline (688 mg, 4.0 mmol), product was obtained after silica gel chromatography (30% to 60% ethyl acetate in hexanes) in 28% yield as a white solid (250 mg).
$^1$H NMR (400MHz, CD$_3$OD). $\delta$ 7.90 (s, 1H), 7.59-7.56 (m, 2H), 7.47-7.44 (m, 2H), 6.45-6.33 (m, 2H), 5.78 (dd, $J = 2.8, 9.1$ Hz, 1H).
$^{13}$C NMR (100MHz, CD$_3$OD). $\delta$ 164.7, 137.7, 131.4, 130.9, 126.7, 121.5, 116.3, 101.1, 78.1.

N-(4-bromophenyl)-2-chloroacetamide (YP-1-37)
Following General Procedure B starting from 4-bromoaniline (688 mg, 4.0 mmol), product was obtained after silica gel chromatography (30% to 60% ethyl acetate in hexanes) in 49% yield as a white solid (491 mg).
$^1$H NMR (400MHz, CD$_3$OD). $\delta$ 7.9 (s, 1H), 7.57-7.53 (m, 2H), 7.50-7.47 (m, 2H), 4.17 (s, 2H).
$^{13}$C NMR (100MHz, CD$_3$OD). $\delta$ 166.0, 137.2, 131.5, 121.6, 116.7, 99.3, 78.1, 42.6.

N-(3,4-difluorobenzyl)acrylamide (YP-1-38)
Following General Procedure A starting from 3,4-difluorobenzylamine (286 mg, 2.0 mmol), product was obtained after silica gel chromatography (40% to 80% ethyl acetate in hexanes) in 61% yield as a white solid (239 mg).
$^1$H NMR (400MHz, CDCl$_3$). $\delta$ 7.56 (t, $J = 6.2$, 1H), 7.07-7.00 (m, 2H), 6.95-6.91 (m, 1H), 6.21-6.20 (m, 2H), 5.83-5.78 (m, 1H), 4.35 (d, $J = 6.1$, 2H).

1-allyl-N-(2,3-dihydro-1H-inden-4-yl)acrylamide (IGA-1-12)
A solution of sodium hydride (96 mg, 4.0 mmol) in tetrahydrofuran (8 mL) was put under nitrogen atmosphere. To the solution was added N-(2,3-dihydro-1H-inden-4-yl)acrylamide (187 mg, 1.0 mmol) in tetrahydrofuran (2 mL). The solution was cooled to 0°C and stirred. 3-bromoprop-1-ene (484 mg, 4.0 mmol) was added after 30 minutes, after which the solution was allowed to warm to room temperature and was stirred overnight. The solution was quenched with water and extracted with ethyl acetate. The crude product was purified via silica gel chromatography (20% ethyl acetate in hexanes) to afford the product in 67% yield as a yellow crystalline solid (151 mg).

\( ^1\text{H NMR} (400\text{MHz}, \text{CDCl}_3) \): \( \delta \ 7.06-7.18 \) (m, 2H), \( 6.80-6.88 \) (m, 1H), \( 6.26-6.37 \) (dd, \( J = 16.8, 2.0 \text{ Hz} \), 1H), \( 5.76-5.96 \) (m, 2H), \( 5.38-5.48 \) (dd, \( J = 10.3, 2.1 \text{ Hz} \), 1H), \( 4.98-5.08 \) (m, 2H), \( 4.40-4.52 \) (ddt, \( J = 14.5, 6.3, 1.3 \text{ Hz} \), 1H), \( 4.00-4.11 \) (ddt, \( J = 14.5, 6.8, 1.2 \text{ Hz} \), 1H), \( 2.82-2.98 \) (m, 2H), \( 2.59-2.79 \) (m, 2H), \( 1.92-2.07 \) (m, 2H).

\( ^{13}\text{C NMR} (100\text{MHz}, \text{CDCl}_3) \): \( \delta \ 165.1, 146.5, 142.4, 137.9, 133.0, 128.4, 127.8, 127.48, 126.1, 124.3, 118.1, 51.6, 33.3, 30.9, 25.0.
N-benzyl-N-(2,3-dihydro-1H-inden-4-yl)acrylamide (IGA-1-14)
A solution of sodium hydride (96 mg, 4.0 mmol) in tetrahydrofuran (8 mL) was put under nitrogen atmosphere. To the solution was added N-(2,3-dihydro-1H-inden-4-yl)acrylamide (187 mg, 1.0 mmol) in tetrahydrofuran (2 mL). The solution was cooled to 0°C and stirred. Benzyl bromide (476 mg, 4.0 mmol) was added after 30 minutes, after which the solution was allowed to warm to room temperature and was stirred overnight. The solution was quenched with water and extracted with ethyl acetate. The crude product was purified via silica gel chromatography (20% ethyl acetate in hexanes) to afford the product in 63% yield as an orange oil (173 mg).

$^1$H NMR (400MHz, CDCl$_3$). δ 7.10-7.35 (m, 7H), 6.74-6.85 (dd, $J = 7.8$, 1.1 Hz, 1H), 6.40-6.55 (dd, $J = 16.8$, 2.1 Hz, 1H), 5.93-6.08 (dd, $J = 16.8$, 10.3 Hz, 1H), 5.49-5.62 (dd, $J = 10.3$, 2.1 Hz, 1H), 4.78-5.10 (m, 2H), 2.85-3.02 (m, 2H), 2.52-2.67 (m, 1H), 2.22-2.37 (m, 1H), 1.83-2.01 (m, 2H).

HRMS (+ESI). Calculated: 278.15 (C$_{19}$H$_{19}$NO). Observed: 278.1538.

N-allyl-N-(2,3-dihydro-1H-inden-4-yl)acrylamide (IGA-1-15)
A solution of sodium hydride (96 mg, 4.0 mmol) in tetrahydrofuran (8 mL) was put under nitrogen atmosphere. To the solution was added N-(2,3-dihydro-1H-inden-4-yl)acrylamide (187 mg, 1.0 mmol) in tetrahydrofuran (2 mL). The solution was cooled to 0°C and stirred. 1-bromohexane (660 mg, 4.0 mmol) was added after 30 minutes, after which the solution was allowed to warm to room temperature and was stirred overnight. The solution was quenched with water and extracted with ethyl acetate. The crude product was purified via silica gel chromatography (20% ethyl acetate in hexanes) to afford the product in 34% yield as a yellow oil (92 mg).

$^1$H NMR (400MHz, CDCl$_3$). δ 7.11-7.25 (m, 2H), 6.86-6.96 (dd, $J = 7.5$, 1.2 Hz, 1H), 6.30-6.40 (dd, $J = 16.8$, 2.1 Hz, 1H), 5.86-6.00 (m, 1H), 5.41-5.51 (dd, $J = 10.3$, 2.1 Hz, 1H), 3.82-3.96 (m, 1H), 3.42-3.56 (m, 1H), 2.90-3.04 (m, 2H), 2.65-2.85 (m, 2H), 1.98-2.16 (m, 2H), 1.47-1.63 (m, 2H), 1.20-1.36 (m, 6H), 0.80-0.90 (m, 3H).

$^{13}$C NMR (100MHz, CDCl$_3$). δ 165.16, 146.54, 142.38, 138.21, 128.59, 127.51, 127.35, 126.09, 124.13, 48.67, 33.26, 31.62, 30.85, 27.85, 26.72, 25.01, 22.59, 14.05.

1-(4-(2-methylquinolin-4-yl)piperazin-1-yl)prop-2-en-1-one (IGA-1-26)
A solution of 2-methyl-4-(piperazin-1-yl)quinolone (455 mg, 2.0 mmol) in DCM (20 mL) was cooled to 0°C. To the solution was added acryloyl chloride (217 mg, 2.4 mmol) followed by triethylamine (243 mg, 2.4 mmol). The solution was allowed to warm to room temperature and stirred overnight. The solution was washed with brine and the crude product was purified via basic alumina chromatography (100% ethyl acetate) to afford the product in 26% yield as a yellow oil (145 mg).

$^1$H NMR (400MHz, CDCl$_3$). δ 7.90-8.05 (m, 2H), 7.58-7.70 (dd, $J = 8.4$, 6.8, 1.5 Hz, 1H), 7.40-7.50 (dd, $J = 8.2$, 6.8, 1.3 Hz, 1H), 6.68-6.76 (s, 1H), 6.56-6.67 (dd, $J = 16.8$, 10.5 Hz, 1H), 6.30-6.40 (dd, $J = 16.8$, 2.0 Hz, 1H), 5.70-5.80 (dd, $J = 10.5$, 2.0 Hz, 1H), 3.70-4.06 (d, $J = 54.7$ Hz, 4H), 3.10-3.30 (t, $J = 5.0$ Hz, 4H), 2.62-2.72 (s, 3H).
$^{13}$C NMR (100MHz, CDCl$_3$). δ 165.5, 159.4, 156.2, 149.2, 129.26, 129.24, 128.3, 127.3, 124.9, 123.0, 121.6, 109.8, 52.3, 51.9, 45.8, 42.0, 25.6.

QUANTIFICATION AND STATISTICAL ANALYSIS

Unpaired Student’s T-tests were used for statistical analyses. Where data were quantified, we report average ± standard error of mean (SEM). Significance is defined as *p<0.05 between described comparison groups. No data was excluded from analysis. More details of quantification and statistical analysis can be found in the figure legends.

DATA AND SOFTWARE AVAILABILITY

Datasets generated for isoTOP-ABPP data are provided in Table S1. Integrated Proteomics Pipeline (IP2) and PROLUCID was used for proteomic data analysis as described in Method Details. The IP2 platform can be obtained from: http://www.integratedproteomics.com.
